Abstract of WO0231471

The invention relates to a device for determining and/or monitoring the viscosity of a medium in a container, comprising a device (2) that can oscillate, a drive/receiving device (4, 5, 6) and a control/evaluation device (8). The device (2) that can oscillate is mounted in a defined measuring position within the container or a device (2) that can oscillate is mounted in such a manner that it dips into the medium to a defined depth of immersion. The drive/receiving device (4, 5) induces oscillation of the device (2) that can oscillate and the drive/receiving device (4, 6) receives the oscillations of the device (2) that can oscillate. The aim of the invention is to use a vibration detector to determine and/or monitor the viscosity (eta) of a medium in a container. To this end, the control/evaluation device (8) determines the viscosity (eta) of the medium on the basis of the frequency-phase curve (f = g(f)) of the device (2) that can oscillate.
